JHAH Medical Summary

Reason for Medical Summary: Family

Patient Identification:[SM.1]
Hamad Nasir Al Helaiw[SM.2] is a[SM.1] 45 y.o. male[SM.2].
DOB:[SM.1] 9/9/1974[SM.2]

Medical Summary

45-year-old male admitted to the emergency room as a case of acute onset A. fib 0 as well as right-sided weakness. He was seen in the emergency room and the clinical impression was that of an acute CVA and was referred to neurology. He did receive TPA per protocol and was admitted to the ICU. He was stabilized and eventually transferred to the medical ward.

The CT scan of the brain revealed a dense left MCA consisting with acute thrombosis with early ischemic changes.

He was placed on the stroke pathway and followed by neurology. He was also evaluated by speech and language pathology as well as rehabilitation services. At this point the patient is receiving physical therapy and is scheduled for transfer to intensive rehabilitation. We have received approval for transfer, however we have not received the final go ahead due to bed availability.

During his hospitalization patient was found to have urinary retention he was seen by urology and an insertion of a Foley catheter was done. Patient will require this Foley for at least a couple of weeks from now and reevaluate again by urology.

Of note the patient has a recent motor vehicle accident x-rays showing nondisplaced healing fracture of the left hip. He was seen by the orthopedic service with the recommendation that the fracture takes about 8 weeks to fully heal. They recommended to keep the knee brace which was provided.[SM.1]
